

Go Learning Resources

Fastest path for experienced developers — no 10-hour tutorials

Step 1 — Learn the Syntax & Concepts (2-3 hrs)

1. Go Tour (Official)

Interactive browser-based intro. Covers all core concepts with runnable examples. Best first stop — no setup needed.

<https://go.dev/tour/welcome/1>

2. Go by Example

One concept per page — goroutines, channels, errors, interfaces, etc. Ideal for experienced devs. Just scan and run.

<https://gobyexample.com>

3. Effective Go (Official Doc)

Explains the Go way of writing idiomatic code. Read after Tour — teaches patterns, not just syntax.

https://go.dev/doc/effective_go

Step 2 — Practice (Ongoing)

4. Exercism — Go Track

Best free practice platform. 140+ exercises with mentor feedback. No fluff, no ads — just clean problems.

<https://exercism.org/tracks/go>

5. LeetCode — Solve in Go

Solve problems you already know, but in Go. Forces correct use of slices, maps, and pointers under pressure.

<https://leetcode.com>

6. Gin Framework (Build a REST API)

Build a real CLI tool or REST API — a Kubernetes helper, file watcher, or HTTP server.

<https://github.com/gin-gonic/gin>

Step 3 — Go Deep (When Needed)

7. TechWorld with Nana — Go in 3 Hours

Best video if you need one. Practical, no padding. Great for seeing concurrency and structs in action quickly.

<https://www.youtube.com/watch?v=yyUHQIec83I>

8. 100 Go Mistakes (Free Summaries)

Teaches what experienced Go devs do wrong. Invaluable once you have written your first 200 lines.

<https://100go.co>

Recommended order: Go Tour → Go by Example → Exercism track → Build a CLI or API. Everything above is free and faster than boot.dev for an experienced developer.

DevOps/MLOps note: Most cloud-native tools (Kubernetes, Terraform, Docker) are written in Go. Look into kubebuilder for writing Kubernetes operators once you are comfortable with Go basics.
